

AURA Lore Entry Builder – Simple Manual (v2)

A friendly guide for anyone — even non-coders — who wants to create or edit lore rules for an AURA-based roleplay chatbot.

1. What This Tool Does

The AURA Lore Entry Builder lets you modify your bot's lore entries using an easy visual interface. You do NOT need to know JavaScript. You do NOT need to touch the CNN engines.

The GUI allows you to:

- Create new lore entries
- Edit, duplicate, and delete existing entries
- Assign emotional, relational, scene, and topic tags using friendly checkboxes
- Automatically generate a complete AURA Engine script that is ready to copy into JanitorAI

The GUI produces AURA-compatible dynamicLore entries AND a full engine script without requiring manual editing.

2. IMPORTANT: JanitorAI Load Order Instructions

AURA uses multiple components:

- The four CNN engines (PULSE, ORBIT, PACE, SCENE)
- The final AURA Engine script you export from the GUI

These MUST be loaded in the correct order on JanitorAI or the system will not function properly.

➡ ****Correct Load Order:****

- 1) PULSE Engine (CNN)
- 2) ORBIT Engine (CNN)
- 3) PACE Engine (CNN)
- 4) SCENE Engine (CNN)
- 5) ****AURA Engine (final output from GUI)****

If AURA is placed ABOVE the CNN engines, it will not receive the required tags or signals and will appear to do nothing.

3. Importing the Base AURA File (CRITICAL)

The GUI does not start with the AURA script built in — it must be imported.

- ➡ Before editing anything, click ****“Import AURA JS / TXT”**** at the top right.
- ➡ Select your original AURA Engine file (AURA Engine.txt or .js).

This loads:

- The full engine script
- Your existing lore entries

Once imported, the GUI can properly rebuild and re-export a complete AURA file. If you skip this step, the GUI will not know where to insert the updated lore array.

4. Layout Overview

The GUI is divided into three major parts:

LEFT SIDEBAR — Entry List

- Shows all lore entries
- +New, Duplicate, Delete buttons
- Clicking an entry loads it into the editor

TOP BAR — Critical Controls

- Visual editor / Code view tab switch

5. Creating and Editing Entries

Step 1 — Make or Select an Entry

- Click +New to create one
- Click an existing entry to edit

Step 2 — Fill Out the Entry Basics

- Entry ID (unique name, no spaces)
- Write into: scenario / personality / both
- Priority (higher = more likely to run)
- Random weight (small randomness factor)
- Min/Max messages, cooldown, max uses (optional pacing controls)

Step 3 — Select Tags (the important part!)

Checkbox groups allow you to describe what the scene **feels like**:

- Emotion
- Subtext
- Relationship
- Power
- Scene distance
- Topic & beat (conversation purpose)

The AURA system compares these tags to the CNN outputs to decide which lore entry should run.

6. Advanced Flags and Raw Tags

Below the pickers are raw lists:

- andAllTags
- andAnyTags
- notTags
- requireAll / requireAny / requireNone

The GUI fills these automatically based on your selections. You only need to edit them manually if you're comfortable with logic rules.

7. Writing Lore Text

The text you enter here is what gets added to the bot.

You may use:

- {{char}} — the bot's character
- {{user}} — you

Example:

LORE: {{char}} seems unusually protective of {{user}} in this moment.

Short, descriptive lines work best.

8. Generating Your New AURA Script

When ready:

- 1) Be sure your AURA Engine has been imported.
- 2) Click ****Generate JS**** at the top.
 - The GUI merges your entries into the AURA template.
- 3) Switch to the ****Code view**** tab to preview the new script.
- 4) Click ****Download JS**** to save it as AURA_Engine_custom.js.

Use this file as the final script loaded **under** the CNN engines in JanitorAI.

9. Reopening & Continuing Work Later

To resume editing in the future:

- 1) Open the GUI HTML file.
- 2) Click Import AURA JS / TXT.
- 3) Select your previously exported AURA_Engine_custom.js.

The GUI will automatically restore all lore entries and allow you to continue editing.

10. Troubleshooting

Entry not firing?

- Too many tags selected
- Tags too strict (switch to “any tag” mode)
- Cooldown or max uses reached

Entry firing too often?

- Add cooldown
- Add more precise tags
- Lower priority

Download JS disabled?

- Generate JS at least once
- Import an AURA template first

JSON errors in Code view?

- Click “Rebuild from GUI” to restore valid JSON

11. Final Notes

This GUI is meant to make AURA accessible to *everyone*, even people who have never edited code.

If you can click checkboxes and write short descriptive text, you can build extremely expressive lorebooks.

Your CNN engines handle emotion, subtext, tone, and topic detection automatically — the GUI simply helps you decide how the bot *responds* to those signals.

Have fun creating!
